Name	Ganidu Sasmitha
Topic	Gaming4World

INSTRUCTIONS TO CANDIDATES:

- Please follow APIIT Lanka documentation and referencing guidelines.
- Please adhere to the above submission date and follow the standard submission procedure for all assessments.
- Please note that the assessment should be submitted online to the Turnitin link on LMS on or before the submission (i.e., hand in) date by 5 p.m.
- Late submissions will be awarded zero (0) unless extenuating circumstances (EC) are upheld.
- The submission will be scanned for plagiarism on Turnitin. Cases of plagiarism will incur a penalty.

1. Purpose of the Gaming web page

The development of the gaming webpage would be a hard challenge for individuals where everything related to gamers, from buying consoles, peripherals, and accessories to the latest gaming news to engaging in an energetic community, would be facilitated. It also provides space for showing game products along with descriptions and their respective features while being capable of providing informative content in the form of reviews, tutorials, and tips. Additionally, the website page can educate the user on hardware compatibility and game recommendations for better decision-making. Beyond the sales and content levels, a gaming webpage provides brand visibility, connects gamers together through shared interests, and promotes events like tournaments or collaborations, thereby providing an immersive experience that is tailored and interactive for gamers.

2. Wireframes

Wireframing for the creation of a website or a service is a perfect example of designing at the structural level. A page wireframe is some prototype created for website structure and situations that users come across, to be determined with navigational needs and user flows. From the following pictures shows my web page wireframes.

Figure 14

- **Desktop view**

In Figure 1, I have displayed the wireframe of my home page. The home page includes our aim of the web site. The web pages are easily navigated with the header buttons. In drawing the wireframe, I allocated space for picture insets and on this home page.

In the wireframe of "about us page," shown in Figure 2, I integrate our vision and mission to define us. The design was simple partitions with textboxes when constructing the about us page. In all, the contact us page arrow allows the user access to the contact page.

Figure 3 shows the upcoming games. For this page I used flex box to display upcoming games. In figure 4 shows consoles, this page also same as upcoming page I use flex box. From this page users can buy computing products.

Figure 5 shows the game page. From this page users can get idea about released games and details about games.

From figure 6 shows my FAQ page. In this page have frequently asked questions and answers for questions and also visitors can send feedback from this page.

Figure 7, wireframe of contact page. In this page contain-act info about our website. Also, visitors can get our contact details and locations from this page.

- **Mobile view**

Figure 8 to 14 shows my mobile view of web page, this is same as desktop view. I used flex-direction column to get contents as column.

3. HTML validity

Figure 15

From figure 15 shows my HTML page validity. HTML validity is always about whether HTML, and other markup languages correctly adhere to the rules and standards set by the World Wide Web Consortium and web standards organizations. For HTML to be valid means that the structure of my webpage is made correctly and that the page functions consistently no matter the browser type or platform. In figure 15 we can see some errors in my web page.

4. CSS validity

Figure 16

Figure 16 shows my CSS validity. This is also same as HTML validity it shows your CSS errors. In my CSS we can see 2 errors from figure 16.

5. Lighthouse testing

Lighthouse testing is an open-source tool developed by Google for the automation of a variety of aspects of web page quality. It examines web performance, accessibility, SEO, and more along with best practices. Its reports on websites are thorough and actionable. Among the tests it runs are page load speed, mobile friendliness, or accessibility concerns by disabled users while using web browser. This gives a lot of liberty to web developers who wish to fine tune their sites for better user and search engine performance.

6. Reflection on skills learned

By creating the most basic web pages through HTML, I have yet started developing skills in the foundational concepts of scaffolding for web development. I put in the correct structure for it using semantic tags like `<header>`, `<section>` and `<footer>`. Working on things like the `<p>`, `<img>` tag, and `<a>` anchors helped me illustrate information on my page by making content interactive. What was most valuable about this exercise was the emphasis that using CSS, we could not just style and layout the page for aesthetics but address the fundamental pieces of web design itself. The practice also increased lots of problem-solving skill: error debugging and the other design styles not always coming good. On all accounts, it's an effective exercise to learn how to construct good content and present it on the web dynamically.

7. Challenges

Another challenge facing me while working with HTML was the alignment and layout of elements, using text, pictures, and links. Initially, the content was a jumble and not equal. The way out was that I discovered with CSS I could create more legible and understandable layout using properties such as margin, padding, and display. Syntax errors were also another thing that I had to find solutions for, such as missing closing tags, which was really what caused the page to show up improperly. I would open the browser developer tools and inspect the code to pinpoint these errors so that I could correct them. Overall, this enhanced the functionality of the web page.
